Search Notes

Examiner Matthews:

Your search results are attached. The search focused on etiologies. I don't find literature which supports the theory of "two distinct etiologies", upon which the inventor's treatment modalities are based. Please look at these results and let me know if we need to refocus the search effort.

PUBLISHER: Harvey Whitney Books Co.

DOCUMENT TYPE: Journal; General Review

LANGUAGE: English

AB A review. Objective: To examine the role of acyclovir in the treatment of Bell's palsy. Data Sources: A search was performed using MEDLINE (1966-Sept. 2002) and the Cochrane Database of Systematic Reviews with the search terms acyclovir, antiviral, idiopathic facial paralysis, Bell's palsy, herpes simplex virus, and corticosteroids. Data Synthesis: Treatment of Bell's palsy is controversial. Recent research has indicated that herpes simplex virus type 1 may be the likely causative agent. Clin. trials and review articles focusing on the use of acyclovir in the treatment of Bell's palsy were reviewed and evaluated. Conclusions: More solid evidence is necessary to validate whether herpes simplex virus type 1 causes Bell's palsy. Limited published clin. studies exist that have used acyclovir for the treatment of Bell's palsy. The results of available trials are contradictory. The American Academy of Neurol.'s practice parameter states that acyclovir, in combination with steroids, is safe and possibly effective for Bell's palsy treatment. Further information is needed from larger prospective, randomized, placebo-controlled trials to clarify the ultimate therapeutic role of acyclovir for Bell's palsy.

CODEN: JCMIDW; ISSN: 0095-1137
PUBLISHER: American Society for Microbiology
DOCUMENT TYPE: Journal
LANGUAGE: English
AB Varicella-zoster virus (VZV) reactivation causes facial nerve
palsy in Ramsay Hunt syndrome (RHS) and zoster sine herpete (ZSH) with and
without zoster rash, resp. In the present study, the authors analyzed the
VZV DNA copy no. in saliva samples from 25 patients with RHS and 31
patients with ZSH using a TaqMan PCR assay to det. differences in the
viral load between the 2 diseases. VZV copy no. in saliva peaked near the
day of the appearance of zoster in patients with RHS. Consequently, VZV
DNA was less frequently detected in patients with RHS who exhibited
facial palsy several days after the appearance of
zoster. These findings suggest that the VZV load in saliva samples
reflects the kinetics of viral reactivation in patients with RHS. In
addn., VZV DNA was equally detected in saliva from patients with RHS and
ZSH, and there was no significant difference in the highest viral copy no.
between patients with RHS and those with ZSH. The VZV load does not
appear to reflect a major difference between RHS and ZSH.

ACCESSION NUMBER: 2000:598118 HCAPLUS
DOCUMENT NUMBER: 134:161520
TITLE: Rapid strip assay for detection of anti-herpes simplex virus antibodies: application to prediction of varicella-zoster virus reactivation in patients with acute peripheral facial palsy
AUTHOR(S): Ohtani, Fumio; Furuta, Yasushi; Horal, Peter; Bergstrom, Tomas
CORPORATE SOURCE: Department of Otolaryngology, Hokkaido University School of Medicine, Sapporo, 060-8638, Japan
SOURCE: Journal of Medical Virology (2000), 62(1), 37-41
CODEN: JMVIDB; ISSN: 0146-6615
PUBLISHER: Wiley-Liss, Inc.
DOCUMENT TYPE: Journal
LANGUAGE: English
AB Varicella-zoster virus (VZV) reactivation causes acute peripheral facial palsy in the majority (88%) of patients who lack anti-herpes simplex virus (HSV) antibodies, suggesting that an absence of anti-HSV antibodies is a reliable serol. marker for the diagnosis of VZV reactivation in patients who are diagnosed initially as idiopathic peripheral facial palsy (Bell's palsy). A simple and rapid immunoassay for detection of anti-HSV antibodies based on HSV type 1 glycoprotein D was developed by modifying the conventional Western blot technique. The assay was evaluated by comparing the results with those of conventional Western blot. In total, 100 sera obtained from patients with acute peripheral facial palsy were tested and judged blindly by two investigators. Twenty-four of 26 HSV-seroneg. sera were obtained from patients with VZV reactivation (Ramsay Hunt syndrome or zoster sine herpette). The sensitivity of the assay was >95% and the specificity was 100%. The two investigators agreed on the diagnosis in 99 of the 100 sera. Thus, the rapid strip assay is applicable to prediction of VZV reactivation in patients diagnosed clin. with Bell's palsy before zoster lesions appear or PCR using saliva samples indicates VZV reactivation.
